Calculated Measures

- Category_AverageProfit
- List of Orders
- Monthly_Target
- Order Details
 - Amount
 - Category
 - Order ID
 - Profit
 - Profit Margin
 - Profit Status
 - Quantity
 - Revenue per Order
 - Sales Category
 - Sub-Category
 - OrderID_Count
 - Orders Data
 - Sales target
 - Totals amount_Subcategory

This calculated column combines the 'Category' and 'Sub-Category' fields into a single text value (e.g., "Clothing - Hankerchief") using the concatenation operator. It provides a unified attribute for grouping or filtering products at a more granular level than Category alone.

Revenue per Order Column:

Assignment 2 - Last saved: Today at 5:37 PM

File Home Help Table tools Column tools

Name: Revenue per Order

Data type: Fixed decimal number

Format: \$ - %

Summarization: Sum

Data category: Uncategorized

Sort by: column

Data groups: Groups

Manage relationships

New column

Calculators

Structure: 1 Revenue per Order = [Order Details][Amount] * [Order Details][Quantity]

Properties

Order ID Amount Profit Quantity Category Sub-Category Profit Margin Profit Status Category Type Revenue per Order Sales Category

Table: Order Details (1,500 rows) Columns: Revenue per Order (845 distinct values)

This calculated column multiplies the 'Amount' and 'Quantity' fields for each row to compute the revenue generated per order line item. It gives a row-level financial metric that can be aggregated later for deeper revenue analysis.

Sales Category:

Assignment 2 - Last saved: Today at 5:37 PM

File Home Help Table tools Column tools

Name: Sales Category

Data type: Text

Format: Text

Summarization: Don't summarize

Data category: Uncategorized

Sort by: column

New column

Calculators

Structure: 1 Sales Category = IF([Order Details][Amount] > CALCULATE(AVERAGE([Order Details][Amount]), ALL([Order Details])), 'Above Average', 'Below Average')

Properties

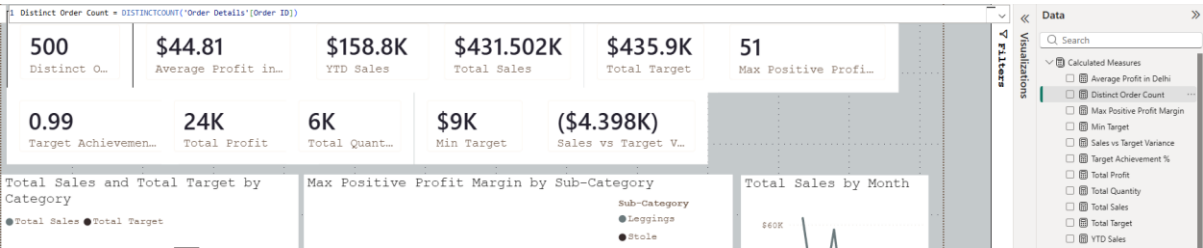

Order ID Amount Profit Quantity Category Sub-Category Profit Margin Profit Status Category Type Revenue per Order Sales Category

Table: Order Details (1,500 rows) Columns: Sales Category (2 distinct values)

This calculated column classifies each order as "Above Average" or "Below Average" by comparing its individual 'Amount' value against the overall average Amount across all orders, using CALCULATE and ALL to compute a fixed benchmark. It enables quick identification of high-value versus low-value transactions.

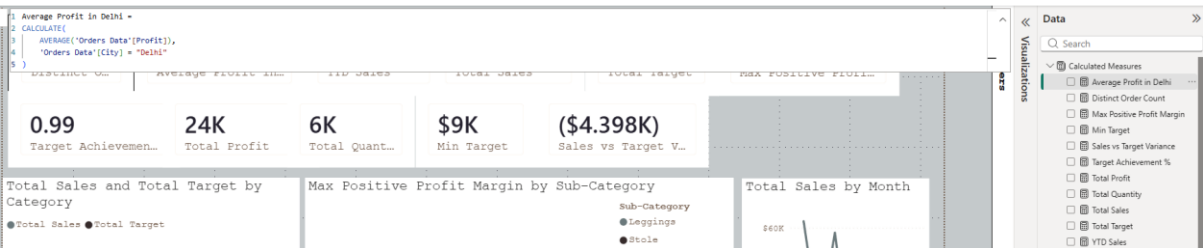

Calculated Measures:

Order Count:

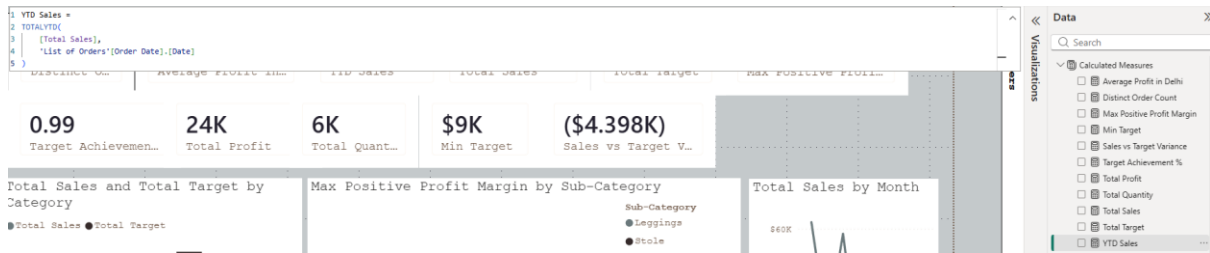

This measure counts the total number of orders in the Order Details table using the COUNT function. It provides a quick summary metric of overall order volume for the business.

Average Profit in Delhi:

This measure calculates the average profit specifically for orders placed in Delhi, using CALCULATE with a filter condition on the City column. It helps assess regional profitability performance for a key market.

Year-to-Date (YTD) Sales:

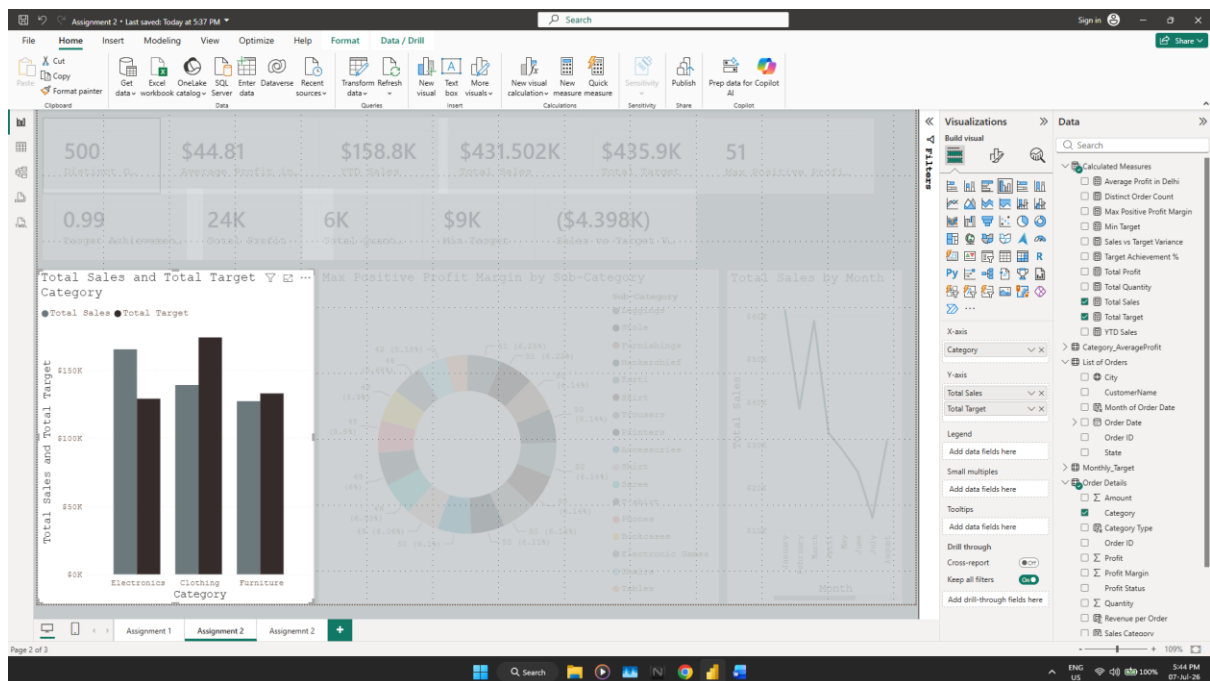

This measure uses the TOTALYTD time-intelligence function to accumulate Total Sales from the beginning of the calendar year up to the current order date in context. It enables tracking of cumulative sales performance over time, supporting year-over-year and progress-to-date analysis.

Task 2:

Data Visualisations:

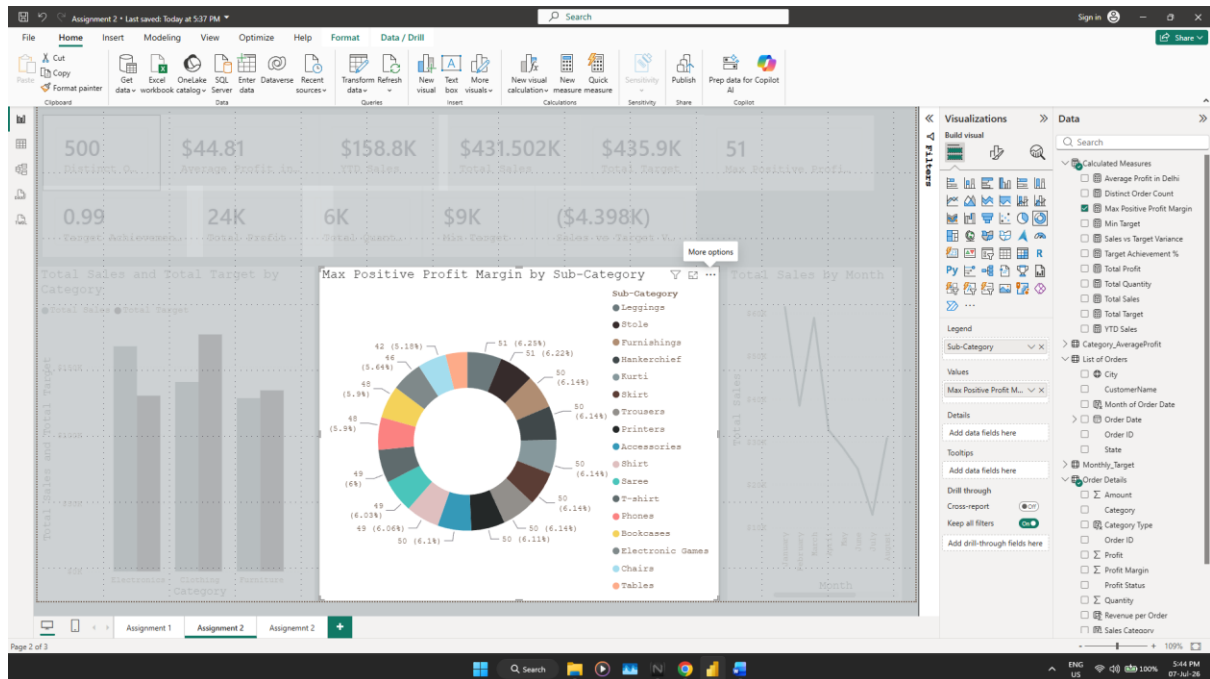

Sales Target Achievement by Category:

This clustered column chart compares Total Sales against Total Target for each product category (Furniture, Clothing, Electronics). It allows quick visual identification of which categories are meeting,

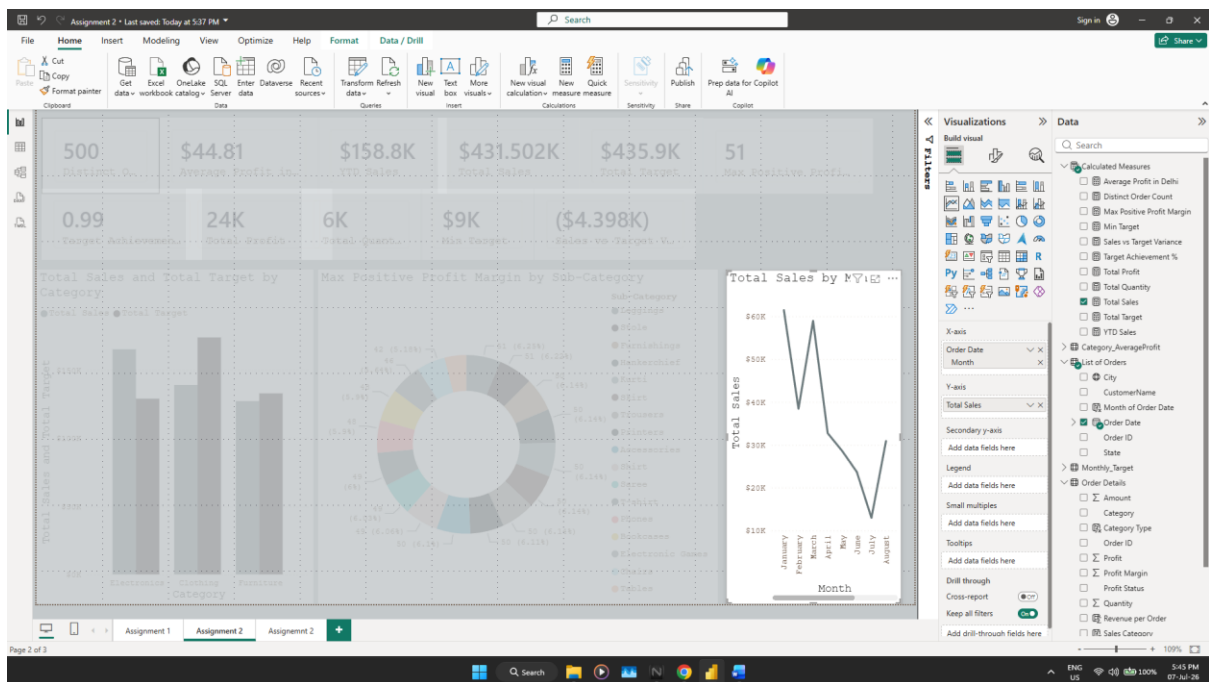

exceeding, or falling short of their sales targets, helping prioritize business focus areas.

Max Profit Margin by Sub-Category:

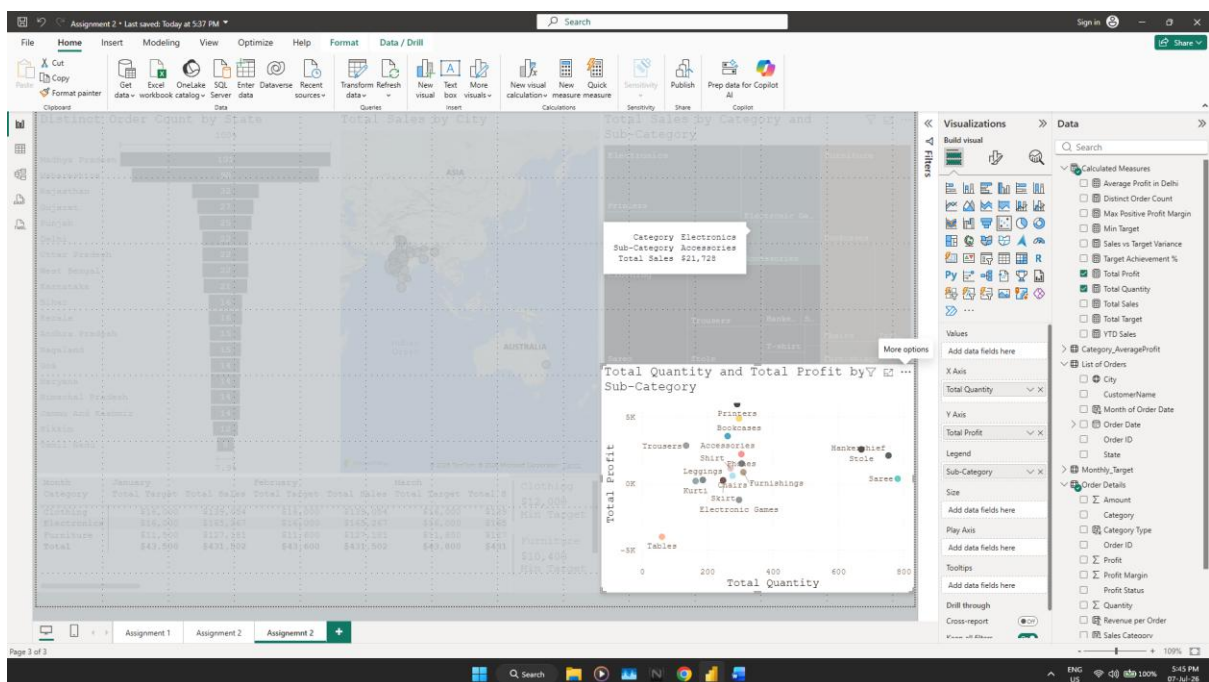

This donut chart displays the maximum profit margin achieved within each product sub-category. It highlights which sub-categories have the potential for high profitability, while sub-categories showing negative values indicate that even their best-performing orders resulted in a loss, flagging them for further review.

Monthly Sales Trend:

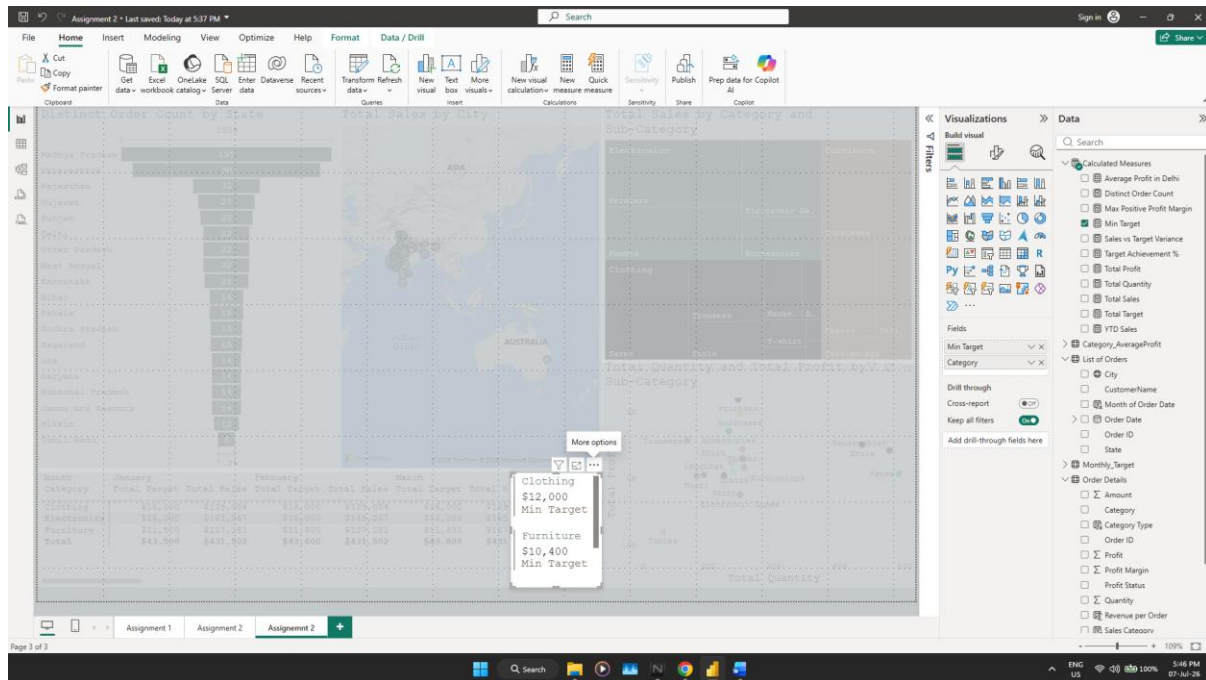

This line chart tracks Total Sales over time by month, making it easy to spot seasonal patterns, growth trends, or dips in performance across the year. It helps identify periods of strong or weak sales for planning and forecasting purposes.

Comparison of Profit and Quantity by Sub-Category:

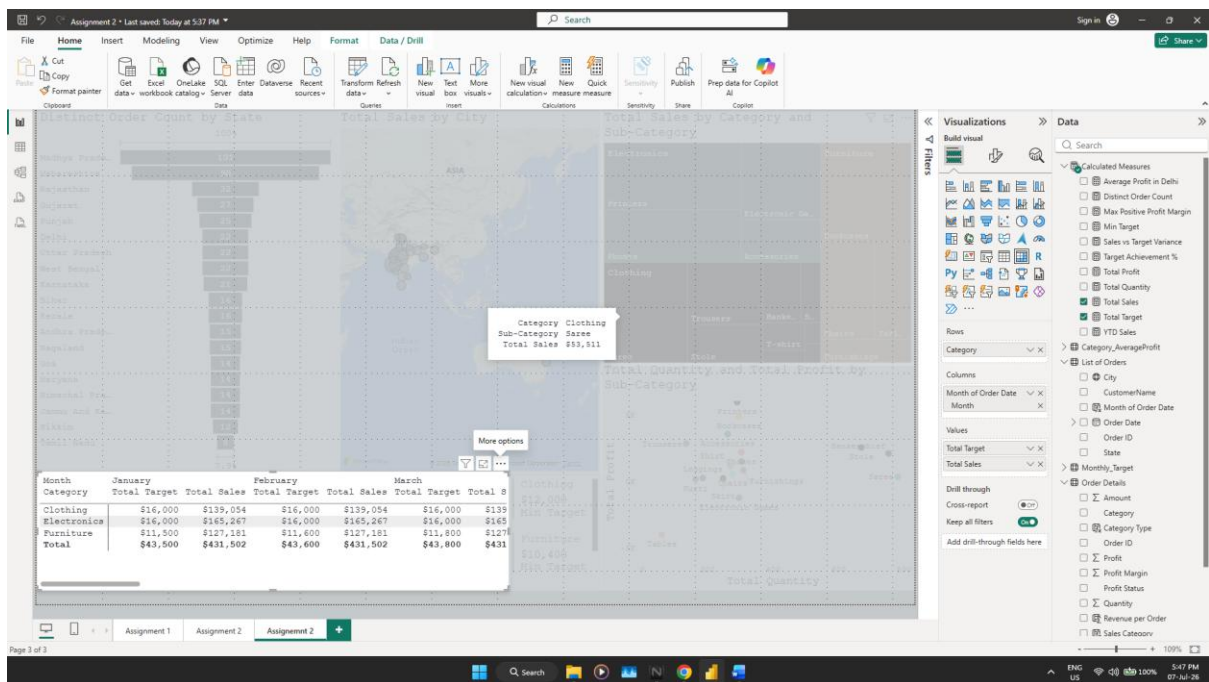

This scatter chart plots Total Quantity sold against Total Profit for each sub-category, with each point representing one sub-category. It reveals relationships between sales volume and profitability – for example, sub-categories with high quantity but low or negative profit indicate high-volume, low-margin products that may need pricing or cost review.

Comparison of Total Sales Amount and Target:

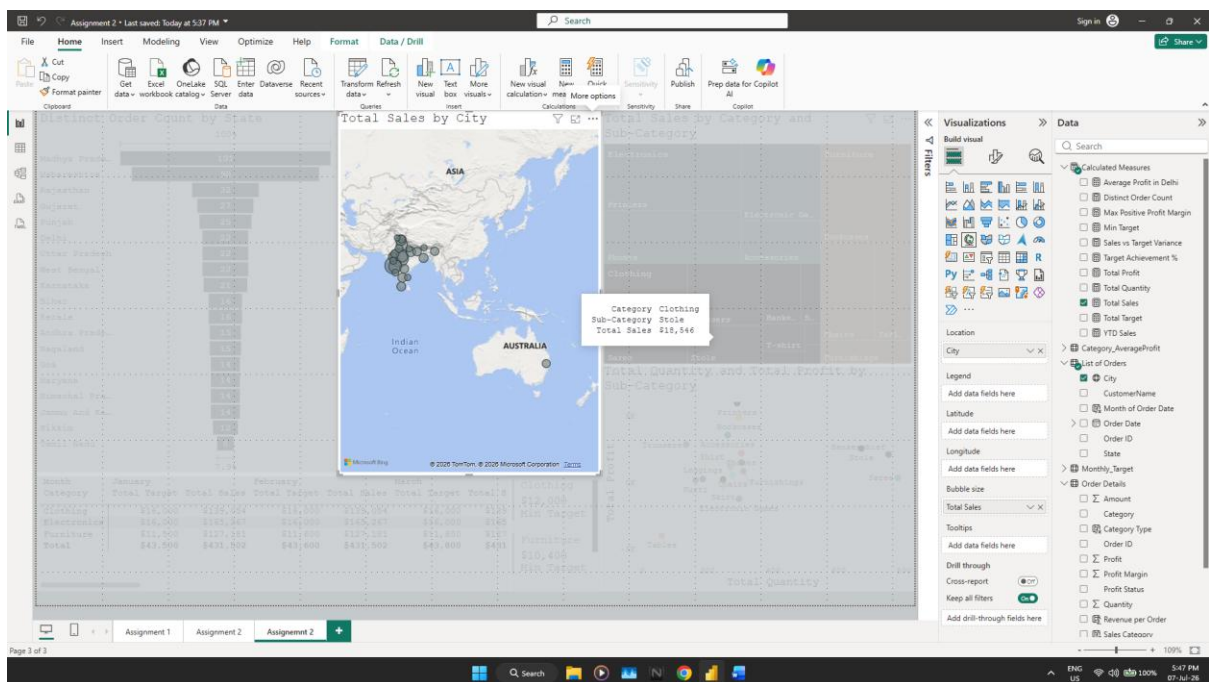

Card visuals display Total Sales and Total Target side by side for an at-a-glance comparison of actual performance versus goal. A multi-row card further breaks down the Minimum Target value for each category segment, showing the lowest target set within each product category.

Sales Performance Matrix:

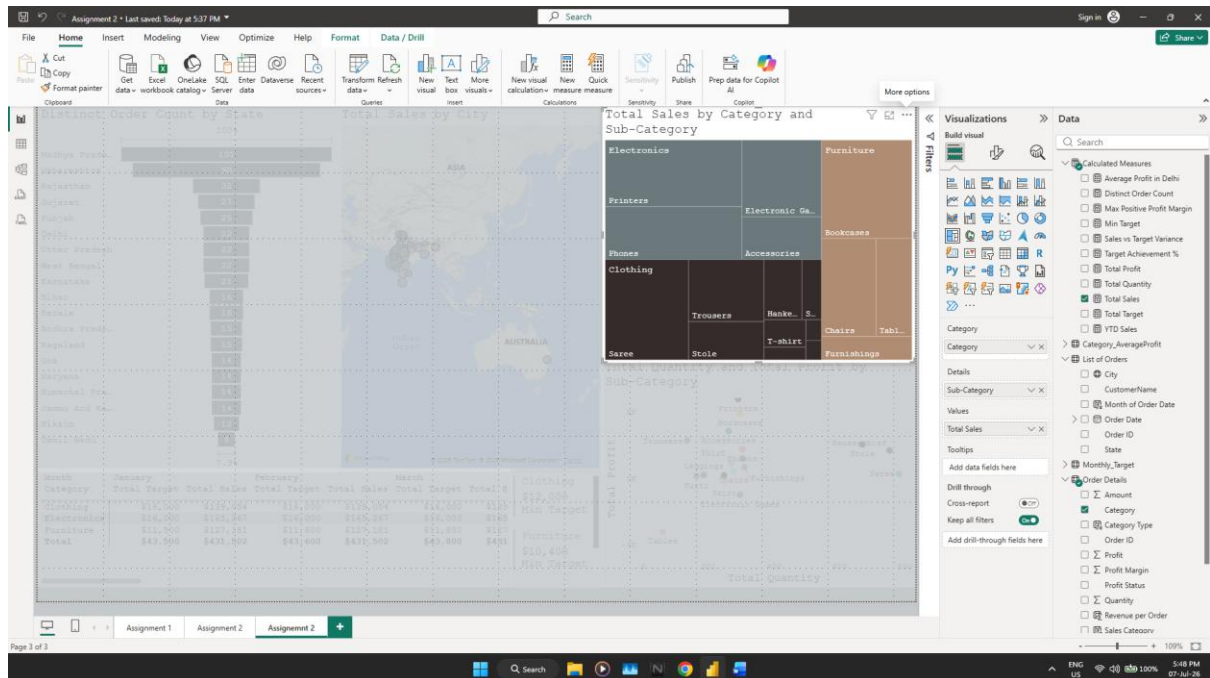

This matrix visual presents a cross-tabulated view of Total Sales and Total Target by Category (rows) and Month (columns). It enables detailed month-by-month performance tracking within each category, making it easy to identify specific periods where targets were met or missed.

Geographic Sales Analysis:

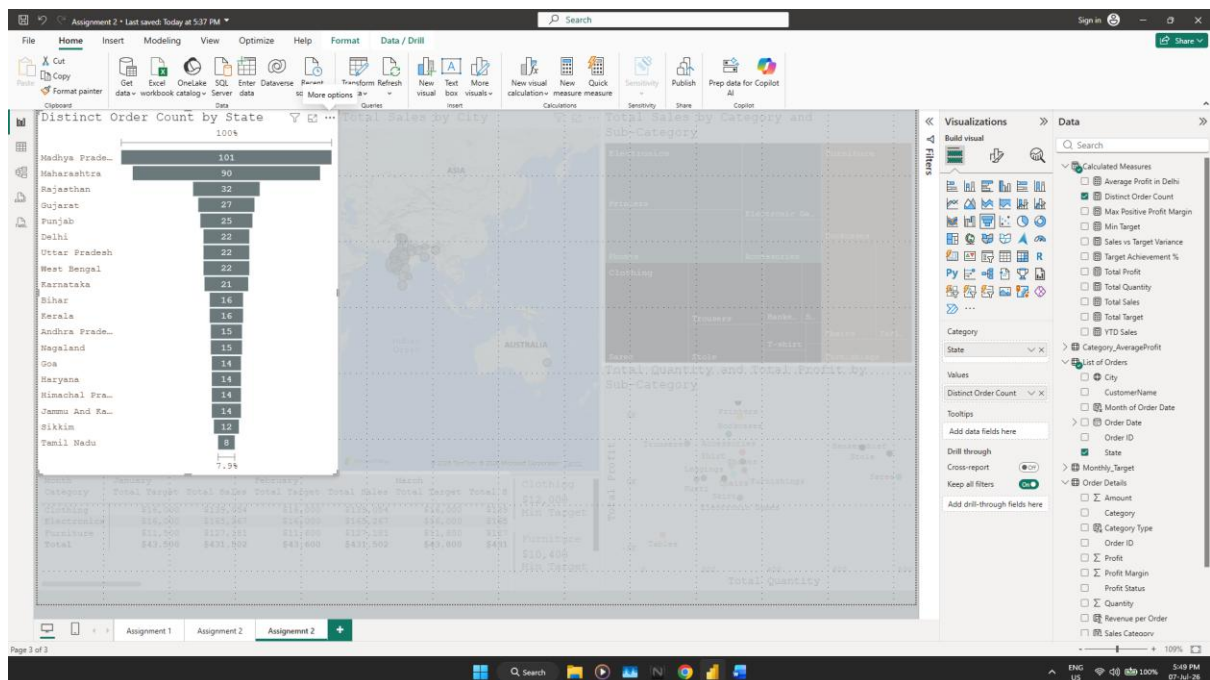

This map visual plots Total Sales by City using bubble markers, with bubble size representing the sales volume for that location. It highlights regional sales concentration, showing which cities contribute the most (or least) to overall revenue.

Sales Distribution by Sub-Category:

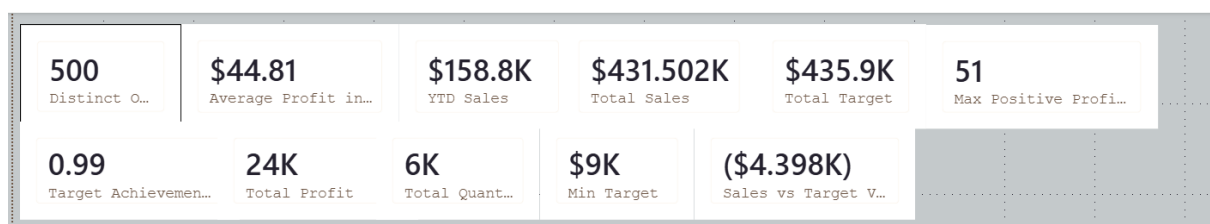

This treemap visualizes Total Sales across all sub-categories, with rectangle size proportional to sales value. It provides an immediate visual ranking of top and bottom-performing sub-categories within the overall sales mix.

Order Count Analysis by State:

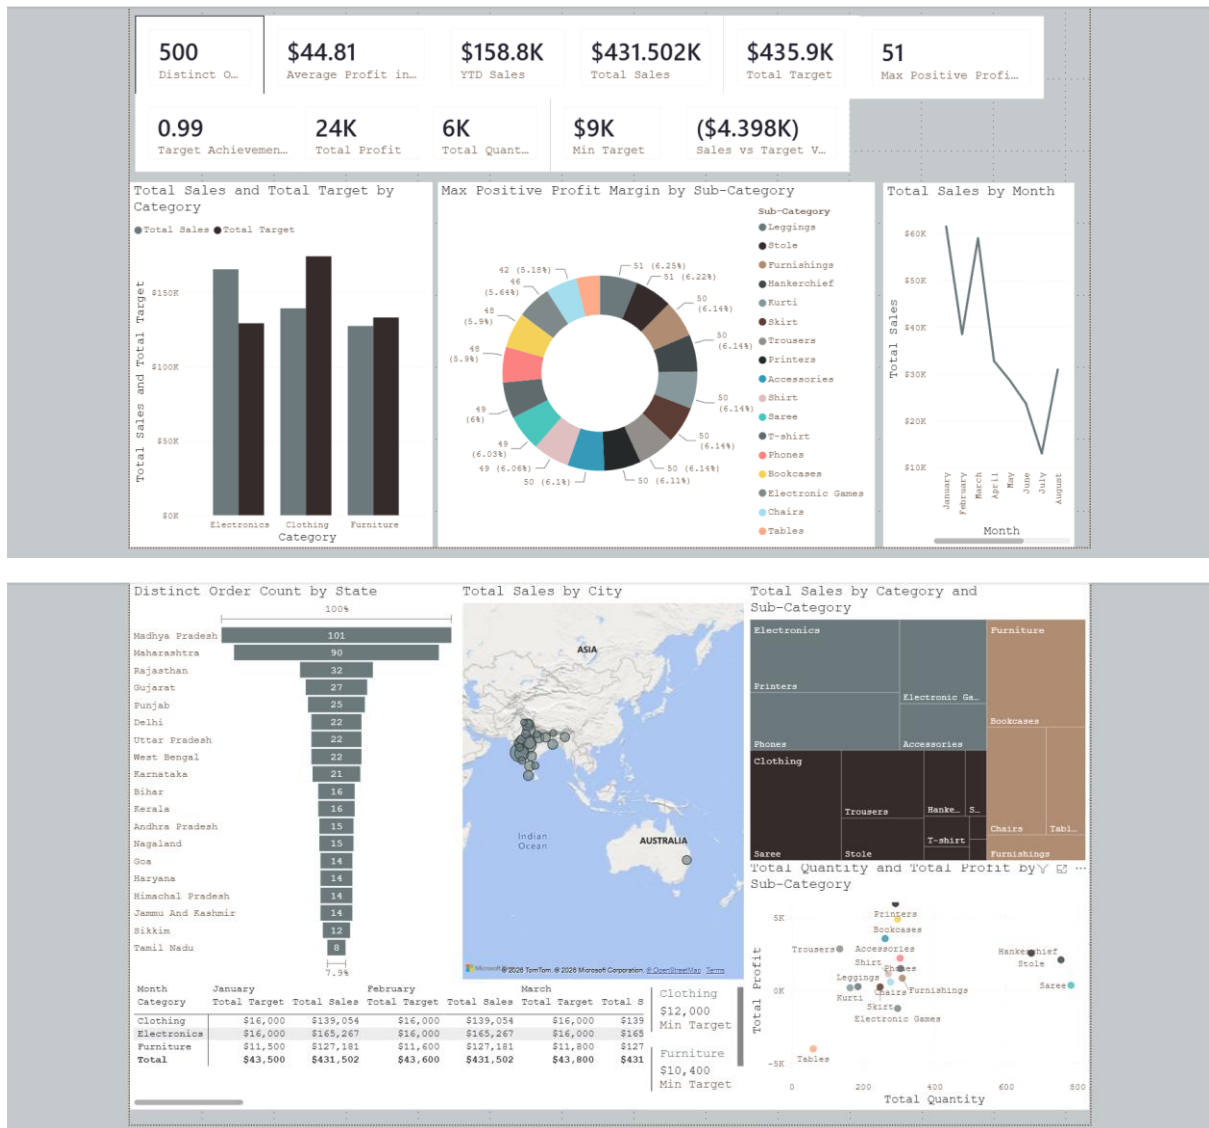

This funnel chart ranks states by their total Order Count in descending order. It highlights which states generate the highest order volume, helping identify key regional markets and areas with lower customer engagement.
